

## HOW TO CORRECTLY IDENTIFY YOUR NABIC VALVE

The information you need is:

- The DN size from the valve body.
- The valve type from the valve body i.e. 542, 500, 500T, 500L, 500F etc.
- The set pressure from the valve label.

Your valve may look slightly different (i.e. a flanged inlet, a temperature probe on the inlet, a gas tight cap etc.), however the information you require is the same and will be in the same or a very similar place.
